

Full Stack + React Native Tasks

You only need to complete any one task out of these 12 tasks, not all of them. Choose the task that best matches your skills and complete it.

Task 1 — Real-Time Chat App with Presence System

Objective: Node.js backend + React Native app banao jisme 1-on-1 aur group chat ho, typing indicators hon, message status track ho (sent → delivered → read), aur user online/offline/last seen dikhaye. Media messages bhi support karein (image, file). Socket.io + Redis presence mandatory.

Example: Ravi app open kare → Priya 'Online' dikhe → Ravi message bheje → Priya ke phone pe instantly aaye → Priya type kare toh Ravi ko 'Priya is typing...' dikhe → Priya message padhe toh blue double tick aaye

Task 2 — Food Delivery App (Zomato Clone — Core Features)

Objective: Backend APIs + React Native app banao — restaurant listing with filters, cart management, real-time order tracking (order placed → preparing → picked up → delivered), aur live rider location update Socket.io se. JWT auth, optimistic UI updates mandatory.

Example: User restaurant search kare → Filter by cuisine/rating → Cart mein add kare → Order place kare → Map pe rider ka live location dikhe → Status bar mein 'Preparing → Out for delivery → Delivered' update ho

Task 3 — Expense Tracker with Bank Statement Parser

Objective: React Native app + Node.js backend — user PDF bank statement upload kare, backend parser kare aur transactions automatically categorize kare (Food, Travel, Shopping), charts dikhao monthly spending ka, aur budget alerts set karo. OCR ya regex parsing implement karo.

Example: User HDFC statement PDF upload kare → Backend 50 transactions parser kare → 'Swiggy 250' → Food category → Month end pe 'You spent 40% more on Food this month' alert aaye → Pie chart mein breakdown dikhe

Task 4 — Video Streaming App with Offline Download

Objective: Node.js backend pe HLS video streaming implement karo (chunked), React Native app mein custom video player banao. User videos offline ke liye download kar sake, download progress track ho, aur downloaded videos internet ke bina play hon. Background download support mandatory.

Example: User video play kare → HLS chunks load hon progressively → 'Download' tap kare → Background mein download ho aur percentage dikhe → Phone offline karo → Downloaded video smoothly play ho

Task 5 — Multi-Vendor E-Commerce Platform

Objective: Multiple sellers apna store manage kar sakein, buyers products search/filter/buy karein. Order management, inventory tracking, seller dashboard with analytics, aur push notifications for order updates. Razorpay/Stripe test mode integration mandatory.

Example: Seller A 10 products list kare → Buyer search kare 'shoes' → Add to cart → Checkout kare → Payment complete ho → Seller ko push notification aaye 'New Order!' → Buyer ko 'Order Confirmed' notification aaye → Seller order status update kare → Buyer ko real-time update mile

Task 6 — Health & Fitness Tracker with Wearable Sync

Objective: React Native app banao jisme manual workout log ho, diet tracking ho, progress charts hon, aur Apple HealthKit / Google Fit se steps/heart rate sync ho. Backend pe user data store ho aur weekly AI-generated insights aayein (Claude/OpenAI API use kar sakte hain).

Example: User subah 8000 steps chale → Google Fit se auto-sync ho → App mein 'Goal 80% complete' dikhe → Dinner mein khana log kare → Backend calculate kare calories deficit → Weekly report mein 'You burned 500 more calories than last week' aaye

Task 7 — Custom Camera App with AR Filters

Objective: React Native Camera se scratch pe camera app banao — custom filters implement karo (brightness, contrast, blur), face detection pe automatic filter apply ho, video recording ho aur gallery mein save ho. Bina Expo Camera ke implement karo — react-native-vision-camera use karo.

Example: Camera open ho → Face detect ho → Auto Snapchat-style filter apply ho → User swipe kare aur filter change kare → Record button hold kare → 30 second video record ho → Gallery mein save ho → Share button se direct WhatsApp pe share ho

Task 8 — Offline-First Maps & Navigation App

Objective: React Native Maps mein offline tile caching implement karo — user pehle se area download kare, internet ke bina bhi map dikhe. Custom route drawing implement karo (polyline), turn-by-turn navigation logic banao, aur background location tracking ho even when app is minimized.

Example: User 'Download this area' tap kare → Map tiles cache hon → Phone airplane mode mein karo → Map perfectly dikhe → User destination set kare → App route draw kare → Background mein location track ho → 'Turn left in 200m' notification aaye

Task 9 — Real-Time Document Scanner with OCR

Objective: Camera se document scan karo—automatic edge detection implement karo (perspective correction), scanned image enhance karo (contrast boost, deskew), Tesseract.js ya ML Kit se OCR karo aur

text extract karo. Multiple pages ko ek PDF mein combine karo. Bina third-party scanner SDK ke.

Example: User table pe rakha document camera se point kare → App automatically edges detect kare aur highlight kare → Capture kare → Auto crop + perspective correct ho → Enhance ho → OCR se text extract ho → 'Save as PDF' tap kare → Multi-page PDF ready ho

Task 10 — Advanced Animation — Super App Onboarding

Objective: Reanimated 3 + Skia use karke ek visually stunning onboarding flow banao — particle animations, morphing shapes, gesture-driven transitions, aur 60fps guarantee karo JS thread block kiye bina. Lottie use karna allowed nahi — sab kuch code se banao.

Example: App open ho → Logo particle effect se assemble ho → Swipe karo → Screen morphing transition ho → Next slide pe interactive element ho jo user drag kar sake → Onboarding complete kare → Satisfying checkmark animation ho → Home screen pe smooth shared element transition ho

Task 11 — Peer-to-Peer File Sharing App

Objective: React Native mein P2P file sharing implement karo — same WiFi pe devices discover hon automatically (Bonjour/mDNS), user select kare file → directly device to device transfer ho bina internet ke, transfer progress dikhao, aur large files chunked transfer hon. WebRTC ya TCP socket use karo.

Example: Ravi aur Priya same WiFi pe hain → Ravi app khole → Priya ka device automatically 'Nearby Devices' mein dikhe → Ravi 500MB file select kare → Send tap kare → Priya ke phone pe accept prompt aaye → Direct P2P transfer start ho → Progress bar dikhe → Complete ho

Task 12 — Custom React Native Bridge Module

Objective: ek Native Module banao scratch se (Java/Kotlin for Android, Swift/ObjC for iOS) jo React Native mein available nahi hai. Example: Custom Biometric Payment Confirmation module jo fingerprint + face ID ke saath amount confirm kare, ya Custom Background Bluetooth Scanner jo BLE devices continuously scan kare.

Example: User payment karne lage → Custom native module trigger ho → Native biometric UI aaye (system Fingerprint scan ho → Success/Failure event React Native ko callback kare → App payment level, not JS) → complete kare → Poora flow 100% native performance pe ho
